

Interface

Note:

- When the chip is powered off, please make sure that VDDIO is powered off before VCC, or VDDIO and VCC are powered off at the same time. See GH3011 Datasheet for timing details.
- If no I/O pin is available on the host side for the module to control /RST, please make sure that the VCC power supply (LDO) can be powered on or off through software; otherwise, the sensor may fail to be reset when malfunctions occur, and thus, it is recommended that /RST should be retained.

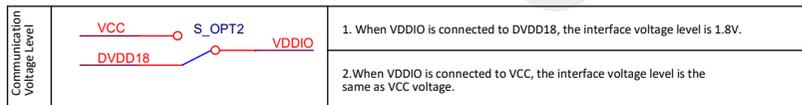

System Power Supply Selection

Scheme	Power Supply	Requirements on VCC Power Supply	Requirements on VLED Power Supply	Remark
Scheme 1 (Preferred)	VCC and VLED share the same power supply.		3.3±0.1V ≥120mA	1.VCC and VLED nets should be shorted together in the schematic. 2.Requirements of VLED power supply on LED voltage drop: a. Red/IR LED voltage drop: Vf @60mA≤ VLED-0.4V. b. Green LED voltage drop: Vf @100mA≤ VLED-0.5V.
Scheme 2	VCC and VLED are powered independently by different power supplies.	2.1-3.3V ≥40mA	3.3-4.5V ≥120mA	Requirements of VLED power supply on LED voltage drop: a. Red/IR LED voltage drop: Vf @60mA≤ VLED-0.4V. b. Green LED voltage drop: Vf @100mA≤ VLED-0.5V.

Note:

If VLED is powered by the battery, evaluation on whether the voltage/current is able to meet the application requirements when the battery power is low should be implemented.

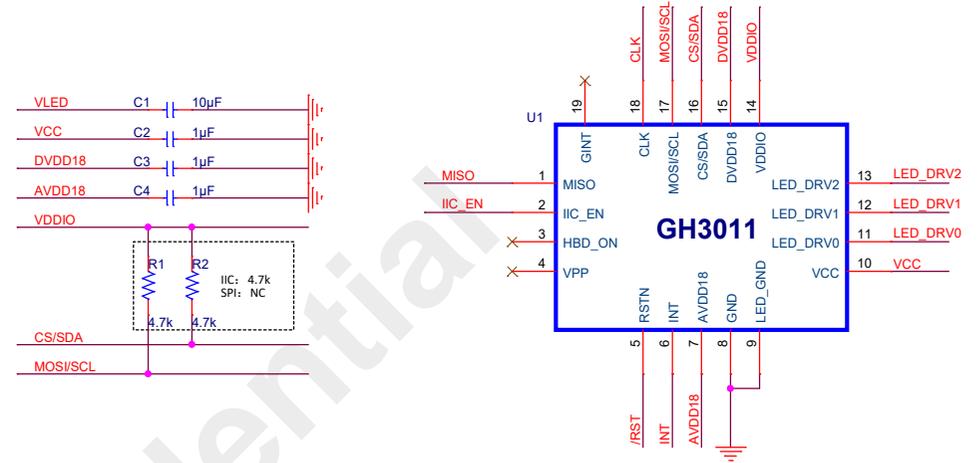

Interface voltage Level Selection

Note:

When the interface voltage level on the host side is not VCC or 1.8V, the main board should supply power to the VDDIO pin of GH3011 module to ensure that the interface voltage level on the host side is identical with that on the module side.

GH3011

Note:

- Pay attention to the heights of the components during mechanical design, in case that there is interference between components.
- IIC pull-up resistors can be placed either on the main board or on FPC. Please do not place them repeatedly.

Optics Application Schemes

Drive Channel	SpO2+HR Application Scheme		Heart Rate Application Scheme		SpO2 Application Scheme	
	LED Selection	Function	LED Selection	Function	LED Selection	Function
LED_DRV0	IR	Wearing detection SpO2 detection	IR	Wearing detection	IR	Wearing detection SpO2 detection
LED_DRV1	Red	SpO2 detection	Green	Heart rate detection	Red	SpO2 detection
LED_DRV2	Green	Heart rate detection	Green	Heart rate detection	NC	

G-sensor Selection

Parameter	Requirement	Description
Measurement range	±4g (g refers to gravitational acceleration)	Resolution< 0.002 g/LSB
Width	≥12 bits	
Sampling frequency	>GH3011 sampling frequency	The sampling frequency of GH3011 can be configured through register and is related to the actual application; commonly used maximum sampling frequency is 200Hz.

Note:

G-sensor is usually placed on the main board.
